Limitations

The following is considered not medically reasonable and necessary:

Genetic testing where either analytical validity, clinical validity, or clinical utility has not been established.
Germline testing may be performed once in a lifetime per beneficiary.
Any laboratory test that investigates the same germline genetic content, for the same genetic information, that has already been tested in the same Medicare beneficiary is not medically reasonable and necessary as it is duplicative. The germline sequence of an individual does not change over time, and therefore repeat testing of the same germline content for the same genetic information does not provide new clinical information.

Coding Guidance

Notice: It is not appropriate to bill Medicare for services that are not covered (as described by the entire LCD) as if they are covered. When billing for non-covered services, use the appropriate modifier.

CPT codes 81355 (VKORC1) and 81227 (CYP2C9) are not considered medically reasonable and necessary for warfarin testing. Please refer to the CMS IOM Publication 100-03, Medicare National Coverage Determinations (NCD) Manual, Chapter 1, Part 2, Section 90.1 Pharmacogenomic Testing to Predict Warfarin Responsiveness.

Prostate Cancer Screening Tests

G0103

Limitations

Screening prostate specific antigen tests are covered at a frequency of once every 12 months for men who have attained age 50 (at least 11 months have passed following the month in which the last Medicare-covered screening prostate specific antigen test was performed).

Prostate Specific Antigen

84153

Limitations

Generally, for patients with lower urinary tract signs or symptoms, the test is performed only once per year unless there is a change in the patient's medical condition.

Testing with a diagnosis of in situ carcinoma is not reasonably done more frequently than once, unless the result is abnormal, in which case the test may be repeated once.

Prothrombin Time

85610

Limitations

1. When an ESRD patient is tested for PT, testing more frequently than weekly requires documentation of medical necessity, e.g., other than chronic renal failure or renal failure unspecified.
2. The need to repeat this test is determined by changes in the underlying medical condition and/or the dosing of warfarin. In a patient on stable warfarin therapy, it is ordinarily not necessary to repeat testing more than every two to three weeks. When testing is performed to evaluate a patient with signs or symptoms of abnormal bleeding or thrombosis and the initial test result is normal, it is ordinarily not necessary to repeat testing unless there is a change in the patient's medical status.
3. Since the INR is a calculation, it will not be paid in addition to the PT when expressed in seconds, and is considered part of the conventional PT test.
4. Testing prior to any medical intervention associated with a risk of bleeding and thrombosis (other than thrombolytic therapy) will generally be considered medically necessary only where there are signs or symptoms of a bleeding or thrombotic abnormality or a personal history of bleeding, thrombosis or a condition associated with a coagulopathy. Hospital/clinic-specific policies, protocols, etc., in and of themselves, cannot alone justify coverage.

Screening for Cervical Cancer with Human Papillomavirus (HPV) Testing

G0476

Limitations

Human Papillomavirus (HPV) testing is a covered benefit once every five years for asymptomatic beneficiaries aged 30 to 65 years in conjunction with the Pap smear test.

Alpha Sort

Z11.51 Encounter for screening for human papillomavirus (HPV); **AND**

and one of the following specified secondary ICD-10 diagnosis codes:

Z01.411 Encounter for gynecological examination (general) (routine) with abnormal findings
Z01.419 Encounter for gynecological examination (general) (routine) without abnormal findings

Numeric Sort

Z01.411
Z01.419

Screening for Hepatitis B Virus (HBV) Infection

G0499, 86704, 86706, 87340, 87341

Limitations

1. An initial screening for hepatitis B virus infection (HBV) is covered for asymptomatic, non-pregnant adolescents and adults at high risk for HBV infection. "High risk" is defined as persons born in countries and regions with high prevalence of HBV infection (i.e., ≥ 2%), US-born persons not vaccinated as infants whose parents were born in regions with a very high prevalence of HBV infection (i.e., ≥ 8%), HIV-positive persons, men who have sex with men, injection drug users, household contacts or sexual partners of persons with HBV infection.
2. Repeat screening would be appropriate annually only for beneficiaries with continued high risk (men who have sex with men, injection drug users, household contacts or sexual partners of persons with HBV infection) who do not receive hepatitis B vaccination.
3. A screening test at the first prenatal visit is covered for pregnant women and then rescreening at time of delivery for those with new or continuing risk factors. In addition, CMS has determined that screening during the first prenatal visit would be appropriate for each pregnancy, regardless of previous hepatitis B vaccination or previous negative hepatitis B surface antigen (HBsAg) test results.

Initial screening for asymptomatic, non-pregnant adolescents and adults at high risk:

Screening for Hepatitis C Virus (HCV) in Adults

G0472

Limitations

1. A single, one-time HCV screening test is covered for adults who are not considered high risk as defined below, but who were born from 1945 through 1965. Those persons born prior to 1945 or after 1965 without high risk factors are not eligible for this benefit.
2. An initial screening for HCV is covered for adults at high risk for HCV infection regardless of birth year. "High risk" is defined as persons with a current or past history of illicit injection drug use and persons who have a history of receiving a blood transfusion prior to 1992.
3. Repeat HCV screening for a sub-set of high risk persons regardless of birth year is covered annually only for persons who have had continued illicit injection drug use since the prior negative HCV screening test.

NOTE: Annual means a full 11 months must elapse following the month in which the previous negative HCV screening took place.

- One annual occurrence of screening for syphilis (i.e., 1 per 12-month period) in men at increased risk,
- Up to two occurrences per pregnancy of screening for chlamydia and gonorrhea in pregnant women who are at increased risk for STIs and continued increased risk for the second screening,
- One occurrence per pregnancy of screening for syphilis in pregnant women,
- Up to an additional two occurrences per pregnancy of screening for syphilis in pregnant women if the beneficiary is at continued increased risk for STIs,
- One occurrence per pregnancy of screening for hepatitis B in pregnant women, and,
- One additional occurrence per pregnancy of screening for hepatitis B in pregnant women who are at continued increased risk for STIs.

Serum Iron Studies

82728, 83540, 83550, 84466

Limitations

If a normal serum ferritin level is documented, repeat testing would not ordinarily be medically necessary unless there is a change in the patient's condition, and ferritin assessment is needed for the ongoing management of the patient. For example, a patient presents with new onset insulin-dependent diabetes mellitus and has a serum ferritin level performed for the suspicion of hemochromatosis. If the ferritin level is normal, the repeat ferritin for diabetes mellitus would not be medically necessary.

When an End Stage Renal Disease (ESRD) patient is tested for ferritin, testing more frequently than every three months requires documentation of medical necessity (e.g., other than chronic renal failure or renal failure, unspecified).

Tumor Antigen by Immunoassay CA 125

86304

Limitations

A CA 125 level may be obtained as part of the initial pre-operative work-up for women presenting with a suspicious pelvic mass to be used as a baseline for purposes of post-operative monitoring. Initial declines in CA 125 after initial surgery and/or chemotherapy for ovarian carcinoma are also measured by obtaining three serum levels during the first month post treatment to determine the patient's CA 125 half-life, which has significant prognostic implications.

The CA 125 levels are again obtained at the completion of chemotherapy as an index of residual disease. Surveillance CA 125 measurements are generally obtained every 3 months for 2 years, every 6 months for the next 3 years, and yearly thereafter. CA 125 levels are also an important indicator of a patient's response to therapy in the presence of advanced or recurrent disease. In this setting, CA 125 levels may be obtained prior to each treatment cycle.
